

RETROSPECTIVE

What went well: we have learnt and improved ourselves during the process of making the group project. It is very efficiently to follow Agile model, we switch back and forth between the artifacts and coding as it is necessary to update the artifacts to reflect what is presented in codes

What can be done better: it is the first time we use Scrum Master to control our project, so there is still many rooms for improvement. We should have assigned every task to a certain use case. By sticking with the use case, which is prioritized by the product owner we can finish the most important first and increase the possibility to meet the deadline.
